

TOTAL NETWORK CONTROL IN YOUR HANDS

It's never been easier to decide who, what, when, where, why and how applications are used on your network.

APPLICATION CONTROL IN ACTION

WatchGuard Application Control is a fully integrated security subscription for all WatchGuard XTM appliances. It enables IT administrators to monitor and control access to web and business applications to enforce policy, and protect productivity and network bandwidth. Why add this subscription to your XTM solution? WatchGuard Application Control tightens security across your extended network and adds productivity safeguards that go straight to the corporate bottom line. And because Application Control is integrated with the XTM appliance, you'll have another powerful layer of defense in a single cost-effective solution – with no additional hardware to buy.

With Application Control, you can selectively allow, block, or restrict access to applications based on a user's department, job function, and time of day, and generate reports on usage.

For example, you could choose to:

- Block use of YouTube, Skype, and QQ at all times, during key business hours, or never
- Block use of all P2P applications for anyone who is not part of the management team
- Allow the marketing department access to Facebook and other social networking sites
- Allow Windows Live Messenger for instant messaging, but disallow using it for file transfers
- Limit streaming media applications to specific times of day
- Report on the top ten applications used in the company
- Report on the use (or attempted use) of applications by any individual in the company.

Only WatchGuard
delivers this
unprecedented
level of application
control in an
affordable, all-in-one
network security
solution.
